Imagine that you are a million miles away from your device. A billion miles away! Oh, and you should be seriously tired, too. For the past five years, a team of Russian and Polish researchers have managed to simulate a million-mile journey. They simulated the entire journey, from takeoff to landing, and found that it would take the aircraft about 13 days (you can

read their blog here). As an aside, let's discuss why this is an interesting experiment. Much of what we do on our smartphones and tablets is through apps. We get directions, we make purchases, and we even manage our health on our devices. But how can we simulate a million miles? What does it take to simulate that kind of journey? There are many categories of power. One of the most important categories is digital

power. This is the power that is consumed when we are using our devices. The most common digital power is that used by the processor. The amount of power is measured in units called milliwatts. That means one thousandth of a watt. So a milliwatt is a thousandth of a watt. This is a decent unit to use, but there are other units that are more useful. As we use our smartphones, we consume radio frequency energy. In one hour,

we might be using our device for 20 minutes for a text or 20 minutes for a phone call. In a year, we might use it for 10 hours. While this doesn't sound like much, it's actually rather a lot. And when we use those phones in the car, they tend to use a good bit of power. They're running the GPS, and who knows what else. What if we were able to simulate that kind of power? That's not a bad goal, but it is a difficult one. And we can't

simply say, “We’ll give our smartphone a million miles.” That would take a few decades to simulate. So we have to make some assumptions. First, we have to assume that we are using our smartphones and tablets for a long time. To do that, we have to assume that we have a cellular network. And, of course, we need data. Lots of it. So, we have to assume that we have connectivity. So here’s the estimate. While we are using our

smartphones and tablets, we will consume about 50 watts. That◆?
