This is the result of the combination of two good programming projects: - First was the soundmerge.exe utility, a free file merger. - Second was the PSCAD, a diagram editor, but the idea was good: with the right programming, anyone can create an image or sound file that will be the core of a screen saver. After a lot of work to the imagefile algorithm, we could achieve this work: Merges all images and sounds contained in a single.txt file. How does it work? - With the help of the player-time calculation algorithm, the image is given every second, or every tenth of second, the main attention. - Each image is shown during the time it is in an active state (the animation must be in a loop or else will be no result) and is shown only with the music file, but if you want to have a screen saver with images and sound, then the image must be shown with the music file, but we've included a screen saver that has animated images. - There is a "pause" button when the program is turned on the computer. (Pause the computer sound when it is turned on) - When you turn off the computer, the screen saver automatically stops playing.
