The Stabilization feature was introduced with, initially, the CS6 and CC patch versions of the program, and it does the perfect job of keeping your frames smooth and regular (when set to "Track Motion"). However, whatever I reviewed these patches, the stabilization feature was not the best option of the bunch. It's a good tool if you're mostly just working with video once it's stabilized. In the latter portion of my time with Photoshop, I used the feature to perfect my wedding photographs, and I was able to do so by moving the center points for each frame after the fact, rather than using the option. In my experience, this feature was ill-fitted for those who often work with very still frame. The mode should either be redesigned or have a more firm "primary stabilization" option, which I didn't encounter in the slightest. While it's possible you may not use some of the concepts related to the Live Batch feature, the feature (which iterates through all selected images in a folder) makes it super easy to carry out most light editing tasks. The tool does involve a short round of administrative tasks, though (see the Detailed option). Normally, I wouldn't have an issue with this, because the admin tasks are almost always followed by additional open folders and processing. Photo editing software, especially photography editing software like Adobe Photoshop and others, have always had a questionable market. Many PC users prefer their digital photos to look grain-free, and often even better, completely unedited. Apple's cameras, and tablets have been able to actively climb into this market by offering excellent editing applications for at scale. While the iPad Pro may have finally won the hearts of the masses, I see a greater opportunity for photoshoppers.
