Adobe Photoshop is like a designer's playground when it comes to colors. It is impossible to account for the millions of combinations of colors in which you could end up and be a good designer is only a minority. This is why I suggest that you use other applications to test your hands and your creativity. Not many other applications can boast Adobe's 32-bit.PSD support, but it makes up for its simplicity in other ways. During the creation of the fonts section, I had to check a tutorial online. This gave me the opportunity to discover that it is possible to use that Scribble font in other tools. I'm not going to lie: I was amazed to see that you can assign the same Scribble font found in Illustrator, and in Photoshop, although it feels more powerful than the one I saw. The number of brushes available is quite impressive and I enjoyed browsing them. As a designer, fonts are often used to create powerful and unique designs. The number of free fonts is limited, but the category is exceptionally rich. Export issues aside, you can use the Mac edition of Lightroom 5 as both the simple workflow application, but also as the RAW converter, and I have performed a quick comparative test to show you just how much better it is to use Lightroom for its intended purpose as compared to Photoshop. Let me start with the simple fact that Photoshop CS6 and CS7 are incompatible with any version of Lightroom or any previous versions. Therefore, you must first create a LR profile to import your PSD into the cloud. But it makes no sense to import a PSD into LR, given that you can make changes directly within LR, as you can with an RT image. After all, you paid for the application, and it is your final destination. It follows that the PSD is also the proper, final destination for a ton of other editing needs. But we are not done yet! Using the built in export feature, Photoshop saves an image with the same name as the PSD file and moves the PSD into a separate folder so it can't be overwritten. It then imports the PSD into Lightroom and adds it inline with your non-library images. Photoshop will then open creating a new document and adding the PSD to it forever, tagging it as the original for the purpose of having a backup copy. While this is all good, it reminds me of the time I rendered an image on my PC with Photoshop and then opened another Lab file that was identical, except it was saved at 8-bit as opposed to 24-bit. This meant the Lab file in Photoshop has the identical version of the image that was created with the one Lab file! But why? Adobe should fix the duplicated "new document" problem by simply not saving a new file. That way, Lightroom's import of Photoshop's update would show you where the PSD image comes from.
